After searching via the Internet understands that it must be updated to version 48, then to version 99 and after this update 120 was possible. I followed the process and got it updated to version 99 without any questions. After version 99 upgrade has no problem with boot, the system works widows 10 pretty good. But the main issue is now it has stopped detecting the keyboard boot menu screen (earlier to 99 this issue was not there I was able to press F2 and use it to put me in bios setup, i am using the same keyboard that worked with previous versions of it's IR USB keyboard) because it i can't get into bios menu (F2) , BIOS Flash Update Menu(F7) or Boot Menu(F10) . System configuration: Intel i5-3570K, Intel DH61WW, 8GB Ram, 2TB HDD, Nvidia 1660Ti (This is what caused me to upgrade my BIOS first, as the graphic card was causing boot issues), Corsair 550W VS550. What can be done to solve this, I tried intel site to find any chipset drivers etc. can not find any supported drivers other than bios on this board. Using it auto detect driver software also did not help. I tried after installing the Drivers keyboard from the manufacturer of the site that did not work. Now I am trying to update the motherboard bios, thinking that it can solve this error. Pressing random keys on the keyboard to boot-screen does happen to me in the BIOS Flash update menu, I tried to update to Version 120 with . BIO File its throwing under ERROR, the same error comes when I try to do it .exe the BIOS update. Which may be the issue here. ERROR THE SCREEN Appears when the BIOS is updated. Any help on this is appreciated. Thanks. Filter by show more games More matching supported products spotlight, featured content, and more. Experts in this field, ready for help - Transition BIOS add support to Microsoft Windows 8About this release- ME firmware: Ignition SKU 7.1.52.1176, 8.0.13.1502- Graphics Integrated Integrated Option ROM: Build 2132 PC 14.34(DH61BE, DH61CR, DH61W, DH61SA)- Integrated Graphics Option ROM: Build 2132 PC 14.34(DH61DL)- Integrated Graphics Option ROM: Build 2132 PC 14.34(DH61ZE)- LAN Option ROM: Intel Boot Agent PXE GE v1.4.03 PXE 2.1 Build 091Which file - Recovery BIOS Update [BE0099, BIO] - A. The BIO file that is used by the F7 BIOS update method or the BIOS recovery process. In the unlikely event that the BIOS update is terminated, the bios may remain in an unused state. Use the recovery BIOS update to recover from this condition. This requires a USB flash drive or CD. - Express BIOS Updates: BEH6110H.86A.0099.EB.EXE - Self-extracting Windows-based update file designed for use on Windows systems. This method is izmantotais. Svarīgas piezīmes: - Kad atjaunināšanas process ir sācies, DO NOT POWER DOWN YOUR SYSTEM SYSTEM update is complete. The update process will take up to 3 minutes. - Update the BIOS on your computer only if a newer version of the BIOS specifically solves the problem you have. Bios updates for computers that don't need it are not recommended. - Downgrading the BIOS to an earlier version is not recommended and may not be supported. An older version of the BIOS may not offer support for the latest processors, bug fixes, critical security updates, or support for the revisions of the latest boards that are currently being manufactured. If you are trying to downgrade to a previous bios version and its Intel ME firmware version is older than what is currently on the motherboard, then the downgrade is not supported. - Be sure to read and follow the instructions in this document before starting the BIOS update. You can print out instructions for easy inquiries. - If the BIOS update process is interrupted, your computer may not function correctly. We recommend that you perform the process in an environment with a steady power supply (preferably with UPS). - Before you update the BIOS, manually record all BIOS settings that have been changed (from the default) so that they can be restored after completing the BIOS update. Express BIOS update instructions: - With the Intel Express BIOS Update utility, you can update the BIOS while in Windows. - Save the Express BIOS update file to the temporary folder of the target Intel NUC. - Double-click .EXE file to run the Express BIOS update. - Follow all the prompts. F7 BIOS flash update instructions: - Download and save recovery bios (. BIO) file on a USB portable device. - Connect the USB device to the target Intel NUC USB port. - Turn on (or restart) Intel NUC. - During boot, when the F7 prompt is displayed, press F7 to enter the BIOS Flash Update Tool. - Select a USB device and press Enter. bio file and press Enter. - Confirm that you want to update the BIOS by pressing Enter. - Remove the USB device. - Restart your computer. Update the Power button menu: - The Power button menu update allows you to update the system BIOS during the boot process and before the operating system loads. However, some Intel NUC models do not include this feature. - Download and save recovery bios (. bio) file on a portable USB device. - Connect the USB device to the Intel NUC USB port when it is turned off (instead of hibernating or sleeping). - Press and hold the power button. The system emits three short beeps from the computer speaker. You can connect the headset to the audio jack on the front panel if intel NUC is available to hear beeps. - After beeps, release the power button before ignoring the 4-second shutdown. - The power button menu is displayed. Menu options may vary depending on the Intel NUC model. - You can do a normal BIOS update by pressing F7 or BIOS recovery by pressing F4. - Wait 2-5 minutes to complete the update. - computer turns off when you recovery process is complete, or it suggests turning it off. - Remove the USB device. - Restart your computer. iFlash update instructions: - Download and save iFlash Update. ZIP file in the temporary folder. - Unzip downloaded file. - Copy . BIO files and iFLASH2.EXE to a bootable USB device (see details below). - Boot the target computer to dos. - At the appropriate directory prompt usb drive, type iFLASH2 / pf XXX.BIO (where XXX.BIO is the file name . bio file) to run the iFlash BIOS update process. BIOS recovery update instructions: - It is unlikely that the BIOS update will be terminated when the bios may remain in an unused state. The recovery process requires the chassis to be opened to move the onboard BIOS configuration jumper. - WARNING: This process is intended to be carried out by a trained technician. - Copy the recovery file (.bio) to a bootable USB device. - Connect the USB device to the target Intel NUC USB port. - Turn off the computer and disconnect the AC power. - Open the chassis and remove the yellow BIOS configuration jumper. See the location of this sweater, see the technical product specification. - Start the system. - Wait 2-5 minutes to complete the update. - Your computer either shuts down when the recovery process is complete, or it will prompt you to shut down your computer. - Remove the USB device from the USB port. - Replace the BIOS configuration jumper. - Restart your computer. To identify your current bios version: - During Boot press F2 to enter bios setup. - The third segment (four-digit number) of the BIOS ID string is the current bios version. - Press ESC to exit the BIOS. About OS Independent BIOS: Although installing a newer bios version you can add new features, update different components, or improve the use of the device, this process is very risky, so the upgrade is recommended only when it is really necessary. In addition, this task should be performed by someone who has the knowledge to successfully complete the installation; regular users can carry it at their own risk. When it comes to applying a new version without taking into account your computer's operating system, the most commonly used method to flash bios is by creating a bootable USB or CD that contains an update file and running it from DOS. About BIOS Update Utility: Using a new bios version can create different fixes, add new features, or improve existing ones; however, this activity is very risky and must be carefully performed in a smooth energy environment (such as that provided by the UPS unit) and only when it is really needed. Basic Input/Output System (BIOS) is a very important piece of software that loads the currently installed operating system and checks all hardware components – so make sure you flash it correctly. When it comes to changing the BIOS version, the update utility looks for a compatible package anywhere on the web and if found it automatically install the desired build if and when your confirmation is given. Note that failure to perform installation can seriously harm your system, and a faulty BIOS can even make it unusable. Therefore, if you plan to upgrade your BIOS, press the download button, receive and install the package, and run the utility to check if a newer version is available. Don't forget to check with our website as often as possible to be up to date with the latest releases. We strongly recommend that you always use the latest version of the driver available. Before installing the device driver, try setting up a system restore point. This will help if you have installed an incorrect or inappropriate driver. Problems may occur if your hardware device is too old or is no longer supported. Longer.
